Professional Summary

Senior Fullstack Engineer with 10+ years of experience designing and building scalable web applications, from high-performance backend APIs to modern, responsive frontend interfaces using Node.js, TypeScript, NestJS, React, and Next.js.

Experienced in cloud-native architectures, event-driven systems, and asynchronous processing pipelines, as well as delivering polished frontend experiences with React, Next.js, and component-driven design systems. Proven track record improving full application reliability, system observability, and automated testing coverage across SaaS platforms.

Strong experience working with AWS infrastructure, relational databases, caching strategies, and queue-based architectures using Redis and BullMQ, combined with deep frontend expertise in state management, SSR/SSG patterns, and building high-quality user interfaces.

Core Technical Skills

Fullstack Engineering

Node.js

NestJS

TypeScript

React

Next.js

REST APIs

GraphQL

Microservices Architecture

Frontend Development

React
Next.js (SSR/SSG/ISR)
State Management (Context, Zustand, Redux)
Component-Driven Design
Tailwind CSS
Responsive UI Development

Distributed Systems

Event-Driven Architecture
Asynchronous Processing
Fault-Tolerant Systems
Scalable Backend Services

Databases

PostgreSQL
MySQL
MongoDB
Redis

Message Queues & Background Processing

Redis
BullMQ
Job Queues
Background Workers

Cloud & Infrastructure

AWS (EC2, S3, Lambda)
Docker
Nginx
DigitalOcean

Observability & Performance

Logging
Monitoring
Performance Optimization
API Scalability

Professional Experience

Fullstack Developer — AmplifiLabs

Remote | March 2025 — Present

Worked as a Fullstack Engineer developing and maintaining end-to-end features for multiple SaaS platforms, owning both backend services and frontend interfaces, with focus on API reliability, UI performance, and automated testing strategies.

Improved application stability by implementing structured test cases across backend and frontend layers, automated QA processes, and full-stack monitoring strategies.

Projects

TIA

Global product classification platform used for import and export operations.

The system processes product descriptions, images, and Harmonized System (HS) codes to determine the correct international trade classification.

Responsibilities

- Developed backend APIs and React-based frontend workflows for product classification
- Implemented backend validation pipelines and data processing logic integrated with Next.js server-side rendering
- Improved system reliability with automated backend and frontend integration tests

Rogo

Operational platform supporting coordination of firefighters and emergency resources during wildfire response in the United States.

Responsibilities

- Developed fullstack features supporting real-time incident management, including backend services and React dashboards for operational coordination
- Implemented API endpoints for resource allocation and built interactive React UI components for real-time operational coordination
- Improved reliability of fullstack services through automated QA workflows covering API contracts and frontend behavior

HeyBatter

Real-time sports platform tracking Major League Baseball (MLB) games and enabling virtual betting simulations based on live game events.

Responsibilities

- Implemented real-time backend APIs consuming external sports data providers, with live-updating React UI for game event visualization
- Developed fullstack services for real-time game event processing and built responsive Next.js frontend for virtual betting simulations
- Improved system performance, API responsiveness, and frontend rendering speed for real-time user experiences

Belter

Real-time sports platform focused on Cricket matches, providing live tracking and simulation-based betting systems.

Responsibilities

- Developed fullstack services for real-time sports data processing, including React components for live match tracking interfaces
- Implemented scalable APIs supporting match data ingestion and built Next.js pages for simulation-based betting systems
- Optimized backend processing pipelines and frontend rendering performance for high-frequency live data updates

Full Stack Developer — Hypergroup

Remote | August 2020 — January 2025

Worked on fullstack architecture and feature development for scalable web applications, delivering both robust backend services and modern frontend experiences for large-scale clients.

Responsibilities

- Developed fullstack features with REST/GraphQL APIs using Node.js, NestJS, and PostgreSQL, combined with React/Next.js frontend implementations
- Designed scalable fullstack architectures supporting high-volume web platforms, from API layer to user-facing interfaces
- Led fullstack standardization initiatives using NestJS, GraphQL, and React component libraries
- Collaborated with cross-functional teams delivering large-scale enterprise solutions
- Contributed to the growth and technical evolution of the ContrataPJ platform

Full Stack Developer — Fleeter

Remote | December 2016 — June 2020

Focused on fullstack development delivering API integrations and frontend interfaces for web and mobile applications, with strong emphasis on cloud-based services.

Responsibilities

- Developed fullstack features using Node.js and TypeScript on the backend and React on the frontend
- Integrated backend APIs with mobile and web frontend applications, ensuring consistent data flow and UX quality
- Implemented cloud-based services using AWS infrastructure
- Improved API scalability, performance, and frontend responsiveness through architectural refactoring

Full Stack Developer — Universo Positivo

Estância Velha, Brazil | January 2015 — June 2020

Worked on fullstack development projects covering both backend service development and frontend feature delivery for e-commerce platforms.

Responsibilities

- Designed backend services and APIs using Node.js and built corresponding frontend interfaces for e-commerce workflows
- Developed scalable fullstack features supporting e-commerce platforms, including product catalog pages, checkout flows, and admin dashboards
- Implemented seamless integrations between backend systems and frontend applications, ensuring consistent and performant user experiences
- Maintained fullstack architecture quality, coding best practices, and component reusability standards
